

- Learn how testing professionals can effectively security test software
- Discover how applications are developed and tested with security in mind
- Learn how to use security requirements to plan your testing efforts
- Explore key aspects of security testing—web security, threat modeling, risk assessment
- Examine technical and team skills you need for success
- Learn to use common security testing tools for a variety of testing purposes

## Course Description

Your organization is doing well with functional, usability, and performance testing. However, you know that software security is a key part of your assurance and compliance strategy for protecting applications and critical data. Left undiscovered, security-related defects can wreak havoc in a system when malicious invaders attack. If you don't know where to start with security testing and don't know what you are looking for, this course is for you. It describes how to get started with security testing, introducing foundational security testing concepts and showing you how to apply those security testing concepts with free and commercial tools and resources. Offering a practical risk-based approach, the instructor discusses why security testing is important, how to use security risk information to improve your test strategy, and how to add security testing into your software development lifecycle.

## Practice of Security Testing

Explore security testing in an informal and interactive workshop setting. Examples are studied through a series of small group exercises and discussions.

## Who Should Attend

This course is appropriate for software development and testing professionals who want to begin doing security testing as part of their assurance activities. Test and development managers will benefit from this course as well. A background in software testing is necessary for this course.

*This class will have several hands-on exercises done in small groups. Laptops are suggested but not required. All exercises are cloud-based so there are no requirements to download programs to your laptop.*

## Course Outline

---

### Introduction to Security Testing

Information Security Background  
CIAA++

### Understanding Software Application Risk

The Software Security Problem  
Understanding Risk  
Threat Modeling  
Architecture Risk Analysis  
*Risk Assessment Exercise*  
Prioritizing Security Assurance

### Application Security Testing Approaches

Types of App Security Testing  
Discovery & Reconnaissance Analysis  
Vulnerability Scanning

### Security Testing to Thwart Attacks

#### Security Testing Authentication

Attacks Against Authentication  
Session IDs and Cookies  
Authentication Testing  
Race Conditions  
Session Management  
Replay Attacks  
Cross Site Request Forgery (CSRF)  
*Testing Authentication Exercise*

#### Security Testing Authorization / Access Control

Testing Access Control  
*Security Testing Authorization Exercise*

Security Assessments

Red Teaming

Security & Compliance Audit

How They Are Similar

How They Are Different

*Reconnaissance and Scanning Demos*

### **Security Requirements**

Functional Security Requirements

Non-Functional Security Requirements

Addressing Conflicts

Identifying Security Requirements

*Security Requirements Exercise*

Use and Abuse Cases

### **Security Testing Input Fields**

Input Validation

Data Validation

Common Attacks

*Security Testing Input Fields Exercise*

### **Database Testing for Security**

Security Testing for Data Storage

*Security Testing Databases Exercise*

### **Security Testing Code and Resources**

### **Integrating Security into Your Testing Process**

Security in an Agile World

Security in a Waterfall World

Developing a Security Test Plan

Tools to Support Security Testing

Security Tools in a DevOps Process

*Exploiting Vulnerabilities Exercise*

### **Wrap Up**

**Price:** \$1545
